

Sit With Us

Will Crain, David Glenn,
Ryan Mitchell, Hazem Tashkandi

Problem Summary

- A lot more effort than we anticipated to get everything synchronized properly
- Project runs in Java, database is in Python
- Lots of communication with the server
- Huge learning experience

Demo

Wrap up

- A lot of stuff changed/morphed
- No interests
 - little return on time invested especially since application is small. Would make matching much more difficult (it was already difficult)
- No locating ability
 - Much, much more complex than we initially believed it would be
 - Easiest solution would probably be a chat
- No ability to immediately invite friends to start a meetup
- Meetup popups instead of two matching screens
- Most future features not implemented
- Core of the application remains unchanged

Wrap up

- Challenges:
 - Server communication in decent time
 - Implementing every small little thing
 - Lots and lots of moving parts, hard to get a handle on all of them
 - Matching and meetup formation
 - Locating other users - didn't solve this
- Overall thoughts
 - We did what we set out to do
 - Happy with the result
 - Could probably use some more design polish, but that is not any of our strong suits.
- Shoutout to Ryan for doing more than his fair share of the project.
